```
最近升级了系统到Mac OS X 10.10 并且更新了XCode6.1和iOS 8.1
```

之前app用到的libmp3lame.a静态库,也要支持64位的模拟器(x86 64)和64位的真机(arm64)指令集。需要重新编译

```
查阅了下资料,按照如下步骤,并做了些注释和改动
```

1. http://sourceforge.net/projects/lame/files/lame/3.99/ 下载lame的最新版本解压到一个文件夹里例如 lame,全路径如下/Users/8wm/Desktop/lame

2. 下载build的脚本,我这里使用的是国外一个朋友的分享

```
https://github.com/kewlbear/lame-ios-build
```

下载之后得到lame-build.sh拷贝到文件夹/Users/8wm/Desktop/lame

3. 用bbedit或者其他编辑器打开这个脚本,按照注释修改

```
cd /Users/8wm/Desktop/lame
```

4. 打开Terminals,

输入

chmod 777 <u>lame-build.sh</u>

sudo -s#

./lame-build.sh

输入系统密码

根据所需, copy lame.h和libmp3lame.a文件到project里,就可以正常使用了。

可以使用命令行, 查看换个库支持的指令集。

开始编译,编译完成之后。生成fat-lame目录和thin-lame目录,分别存放合并所有指令集的静态库,以及各指令集的静态库.

lipo -info libmp3lame.a

```
Architectures in the fat file: libmp3lame.a are: armv7 armv7s i386 x86_64 arm64
以下是build的脚本,请注意黄色的字和注释。
        [plain] w plain wy C &
  make distclean
  CONFIGURE_FLAGS="--disable-shared --disable-frontend"
  ARCHS="arm64 armv7s x86_64 i386 armv7"
  # directories
  # SOURCE是下载lame源码包,解压后的目录,可以把sh脚本放到这个目录,source改为""
  # FAT是所有指令集build后,输出的目录,所有静态库被合并成一个静态库
  FAT="fat-lame"
  # SCRATCH是下载lame源码包,解压后的目录,必须是绝对路径
  SCRATCH="/Users/8wm/Desktop/lame"
  # must be an absolute path
  # THIN 各自指令集build后输出的静态库所在的目录,每个指令集为一个静态库
  THIN=`pwd`/"thin-lame"
  COMPILE="y"
  LIPO="y"
  if [ "$*" ]
  then
     if [ "$*" = "lipo" ]
